

4-Bit Bidirectional Voltage-Level Translator for Open-Drain and Push-Pull Application UM3204H CSP12 1.9×1.4 UM3204Q QFN14 3.5×3.5 UM3204UE TSSOP14

General Description

The UM3204 is quad channel ESD-protected level translator provide the level shifting necessary to allow data transfer in a multi-voltage system. Externally applied voltages, V_{CCB} and V_{CCA} , set the logic levels on either side of the device. A low-voltage logic signal present on the V_{CCA} side of the device appears as a high-voltage logic signal on the V_{CCB} side of the device, and vice-versa. The UM3204 bidirectional level translator utilizes a transmission-gate based design to allow data translation in either direction ($V_{CCA} \leftrightarrow V_{CCB}$) on any single data line. The UM3204 accepts V_{CCA} from +1.65V to +3.6V and V_{CCB} from +2.3V to +5.5V, making it ideal for data transfer between low-voltage ASICs / PLDs and higher voltage systems.

The UM3204 enters a three-state output mode to reduce supply current when output enable (OE) is low. The UM3204 is designed so that the OE input circuit is supplied by V_{CCA} . $\pm 5kV$ ESD protection on the V_{CCB} side for greater protection in applications that route signals externally. The UM3204 is a quad level translator available in CSP12 1.9×1.4, QFN14 3.5×3.5 and TSSOP14 packages.

Applications

- SPI, MICROWIRE, and I²C Level Translation
- Low-Voltage ASIC Level Translation
- Smart Card Readers
- Cell-Phone Cradles
- Portable POS Systems
- Portable Communication Devices
- Low-Cost Serial Interfaces
- Cell-Phones
- GPS
- Telecommunications Equipment

Features

- Max Data Rates: 24Mbps(Push Pull), 2Mbps(Open Drain)
- Bidirectional Level Translation
- 1.65V to 3.6V on A Port and 2.3V to 5.5V on B Port($V_{CCA} \le V_{CCB}$)
- ±5kV ESD Protection on B Port
- No Power-Supply Sequencing Required V_{CCA} or V_{CCB} Can Be Ramped First
- CSP12, QFN14 and TSSOP14 Packages

Note1. Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

Note2. The value of V_{CCA} and V_{CCB} are provided in the recommended operating conditions table.

Applications Information

The UM3204 can be used in level-translation applications for interfacing devices or systems operating at different interface voltages with one another. The UM3204 is ideal for use in application where an open-drain driver is connected to the data I/Os. The UM3204 can also be used in applications where a push-pull driver is connected to the data I/Os, but the UM3304 might be a better option for such push-pull applications.

Block Diagram

The UM3204 (block diagram see Figure 1) does not require a direction-control signal to control the direction of data flow from A to B or from B to A. Each A-port I/O has an internal 10-k Ω pull-up resistor to V_{CCA}, and each B-port I/O has an internal 10-k Ω pull-up resistor to V_{CCB}. During a rising edge, the one-shot turns on the PMOS transistors (PU1, PU2) for a short duration, which speed up the low-to-high transition.

Figure 1 Block Diagram of UM3204 I/O Cell

Input Driver Requirements

The fall time (t_{fA} , t_{fB}) of a signal depends on the output impedance of the external device driving the data I/Os of the UM3204. Similarly, the t_{PHL} and the maximum date rates also depend on the output impedance of the external driver. The values for t_{fA} , t_{fB} , t_{PHL} , and the maximum date rates in the data sheet assume that the output impedance of the external driver is less than 50 Ω .

Power Up

During operation, ensure that $V_{CCA} \le V_{CCB}$ at all times. During power-up sequencing, $V_{CCA} \ge V_{CCB}$ does not damage the device, so any power supply can be ramped up first. The UM3204H/UM3204Q/UM3204UE has circuitry that disables all output ports when either V_{CC} is switched off ($V_{CCA/B}$ =0V).

Enable and Disable

The UM3204 has an OE input that is used to disable the device by setting OE = low, which places all I/Os in the high-impedance (Hi-Z) state. The disable time (tdis) indicates the delay between the time when OE goes low and when the outputs actually get disabled (Hi-Z). The enable time (ten) indicates the amount of time the user must allow for the one-shot circuitry to become operational after OE is taken high.

Pull-up or Pull-down Resistors on I/O Lines

Each A-port I/O has an internal 10-k Ω pull-up resistor to V_{CCA}, and each B-port I/O has an internal 10-k Ω pull-up resistor to V_{CCB}. If a smaller value of pull-up resistor is required, an external resistor must be added from the I/O to V_{CCA} or V_{CCB} (in parallel with the internal 10-k Ω resistor).

Test Circuits

A. C_L includes probe and jig capacitances.

B. Waveform 1 is for an output with internal conditions such that the output is low, except when disabled by the output control.

Waveform 2 is for an output with internal conditions such that the output is high, except when disabled by the output control.

C. All input pulses are supplied by generators having the following characteristics: PRR \leq 100MHz, Z₀=50 Ω , dv/dt \geq 1V/ns.

D. The outputs are measured one at a time, with one transition per measurement.

E. t_{PLZ} and t_{PHZ} are the same as t_{dis} .

F. t_{PZL} and t_{PZH} are the same as t_{en} .

G. t_{PLH} and t_{PHL} are the same as t_{pd} .

H. V_{CCI} is the V_{CC} associated with the input port.

I. V_{CCO} is the V_{CC} associated with the output port.

J. All parameters and waveforms are not applicable to all devices.
