

高 ESD 防护、单电源供电 RS-232 收发器

UM232EESE SOP16
UM232EEPE DIP16
UM232EEUE TSSOP16

描述

UM232EExE系列是低功耗单电源RS232接口。该器件由两个线路驱动器、两个线路接收器和2倍输出电荷泵电路组成。该器件符合TIA/EIA-232标准的要求，提供异步通信控制器和串行端口连接器之间的电气接口。片内电荷泵和4个小型外部电容器作为板载DC-DC转换器，允许芯片可由5V单电源供电，无需 $\pm 10\text{V}$ 电源，降低了成本并节省电路板空间。该器件的数据信号传输速率超过250kbps。驱动器的压摆率在内部设置为小于 $30\text{V}/\mu\text{s}$ ，接收器具有内部噪声滤波功能，无需外部压摆率和滤波电容，以确保运行的可靠性。驱动器输入和接收器输出兼容TTL和CMOS。UM232EExE采用16引脚DIP、SOP和TSSOP封装，可在消费级和工业级温度范围内工作。

UM232EExE的ESD等级达到 $\pm 8\text{kV}$ 人体放电模型和 $\pm 15\text{kV}$ IEC61000-4-2空气间隙放电，且无闩锁现象。该器件使用4个 $0.1\mu\text{F}$ 电容，降低了系统成本并节省电路板空间。

应用

- 笔记本电脑和掌上电脑
- 电池供电设备
- 手持设备
- POS 终端

特性

- RS-232总线引脚ESD保护
 - $\pm 8\text{kV}$ ，人体放电模型
- 5V单电源供电
- 低功耗， I_{CC} 最大15mA
- 工作速率高达 250kbps
- 接收器具有噪声滤波功能
- 闩锁性能(Latch-up)超过200mA

Pin Descriptions

Pin No. SOP/DIP/TSSOP	Pin Name	Function
1,3	C1+, C1-	Terminals for Positive Charge Pump Capacitor
2	V+	+2V _{CC} Voltage Generated by the Charge Pump
4,5	C2+, C2-	Terminals for Negative Charge Pump Capacitor
6	V-	-2V _{CC} Voltage Generated by the Charge Pump
7,14	T_OUT	RS-232 Driver Outputs
8,13	R_IN	RS-232 Receiver Inputs
9,12	R_OUT	RS-232 Receiver Outputs
10,11	T_IN	RS-232 Driver Inputs
15	GND	Ground
16	V _{CC}	+4.5V to +5.5V Supply Voltage Input

Absolute Maximum Ratings (Note 1)

Symbol	Parameter	Value	Unit
V _{CC}	Supply Voltage on V _{CC}	-0.3 to +6	V
V ₊	Voltage on V ₊	(V _{CC} - 0.3) to +14	V
V ₋	Voltage on V ₋	-14 to +0.3	V
T_IN	Voltage on T_IN	-0.3 to (V _{CC} + 0.3)	V
R_IN	Voltage on R_IN	±30	V
T_OUT	Voltage on T_OUT	(V ₋ - 0.3) to (V ₊ + 0.3)	V
R_OUT	Voltage on R_OUT	-0.3 to (V _{CC} + 0.3)	V
	Short-Circuit Duration, T_OUT	Continuous	
P _D	Continuous Power Dissipation at T _A =70 °C	SOP16	696
		DIP16	842
		TSSOP16	754.7
T _A	Operating Temperature Range	-40 to +85	°C
T _{STG}	Storage Temperature Range	-65 to +165	°C
T _L	Maximum Lead Temperature for Soldering 10 Seconds	+300	°C

Note 1: Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Electrical Characteristics

($V_{CC}=+5V \pm 10\%$, $C1-C4=0.1\mu F$, $T_A=T_{MIN}$ to T_{MAX} , unless otherwise noted. Typical values are at $T_A=25^\circ C$)

Parameter	Symbol	Conditions	Min	Typ	Max	Unit

Detailed Description

The UM232EExE consists of three sections: charge-pump voltage converters, drivers, and receivers. These E versions provide extra protection against ESD. They survive $\pm 8\text{kV}$ discharges to the RS-232 inputs and outputs, tested using the Human Body Model. When tested according to IEC61000-4-2, they survive $\pm 8\text{kV}$ contact-discharges and $\pm 15\text{kV}$ air-gap discharges. The rugged E versions are intended for use in harsh environments or applications where the RS-232 connection is frequently changed. The UM232EExE devices have internal charge pump voltage converters which allow them to operate from a single +5V supply. The charge pumps will operate with polarized or non-polarized capacitors ranging from 0.1 to $10\mu\text{F}$ and will generate the $\pm 9\text{V}$ needed to generate the RS-232 output levels.

RS-232 Drivers

The drivers are inverting transmitters, which accept TTL or CMOS inputs and output RS-232 signals with an inverted sense relative to the input logic levels. Typically the RS-232 output voltage swing is $\pm 9\text{V}$. Even under worst case loading conditions of $3\text{k}\Omega$ and 2500pF , the output is guaranteed to be $\pm 5\text{V}$, which is consistent with the RS-232 standard specifications. The transmitter outputs are protected against infinite short-circuits to ground without degradation in reliability. The instantaneous slew rate of the transmitter output is internally limited to a maximum of $30\text{V}/\mu\text{s}$ in order to meet the RS-232 standard. The smooth transition of the loaded output from V_{OL} to V_{OH} clearly meets the monotonicity requirements of the RS-232 standard.

RS-232 Receivers

The receivers convert RS-232 input signals to inverted TTL signals. The input thresholds are 0.8V minimum and 2.4V maximum, again well within the 3V RS-232 requirements. The receiver inputs are also protected against voltage up to 30V. A $5\text{k}\Omega$ pull down resistor to ground will commit the output of the receiver to a high state when the pin is float. In actual system applications, it is quite possible for signals to be applied to the receiver inputs before power is applied the receiver circuitry. This occurs, for example, when a PC user attempts to print, only to realize the printer wasn't turned on. In this case an RS-232 signal from the PC will appear on the receiver input at the printer. When the printer power is turned on, the receiver will operate normally. All of these enhanced devices are fully protected.

ESD Protection

UM232EExE devices have standard ESD protection structures incorporated on the pins to protect against electrostatic discharges encountered during assembly and handling. In addition, the RS-232 bus pins (driver outputs and receiver input) of these devices have an extra level of ESD protection. Advanced ESD structures were designed to successfully protect these pins against ESD discharge of $\pm 8\text{kV}$ Human Body Model when powered down or up.

Test Circuits

Typical Operating Circuits

Figure 2

Applications Information

Capacitor Selection

The capacitor type used for C1–C4 is not critical for proper operation. The UM232EExE, require 0.1 μ F capacitors, although in all cases capacitors up to 10 μ F can be used without harm. Ceramic dielectrics are suggested for the 0.1 μ F capacitors. When using the minimum recommended capacitor values, make sure the capacitance value does not degrade excessively as the operating temperature varies. If in doubt, use capacitors with a larger (e.g., 2x) nominal value. The capacitors' effective series resistance (ESR), which usually rises at low temperatures, influences the amount of ripple on V₊ and V₋. Use larger capacitors (up to 10 μ F) to reduce the output impedance at V₊ and V₋. Bypass V_{CC} to ground with at least 0.1 μ F capacitor. In applications sensitive to power-supply noise generated by the charge pumps, decouple V_{CC} to ground with a capacitor the same size as (or larger than) the charge pump capacitors (C1–C4).

V₊ and V₋ as Power Supplies

A small amount of power can be drawn from V₊ and V₋, although this will reduce both driver output swing and noise margins. Increasing the value of the charge-pump capacitors (up to 10 μ F) helps maintain performance when power is drawn from V₊ or V₋.

Driving Multiple Receivers

Each transmitter is designed to drive a single receiver. Transmitters can be paralleled to drive multiple receivers.

High Data Rates

These transceivers maintain the RS-232 ± 5.0 V minimum driver output voltages at data rates of over 250 kbps.

GREEN COMPLIANCE

Union Semiconductor is committed to environmental excellence in all aspects of its operations including meeting or exceeding regulatory requirements with respect to the use of hazardous substances. Numerous successful programs have been implemented to reduce the use of hazardous substances and/or emissions.

All Union components are compliant with the RoHS directive, which helps to support customers in their compliance with environmental directives. For more green compliance information, please visit:
