

3.3V 四路LVCMOS 差分线路接收转换器

UM3403UG TSSOP16

1 描述

UM3403UG是一款四通道LVDS线路接收器/转换器，支持高达400Mbps（200 MHz）的数据速率，并具备低功耗特性。该接收器内置输入失效保护电路，可在输入开路或端接（ 100Ω ）条件下输出已知电压。该器件的四个独立输入通道兼容多种差分信号标准，包括M-LVDS、LVDS、LVPECL和HCSL，并能将其转换为单端3.3V LVCMOS电平信号。

UM3403UG还可提供高电平和低电平有效/无效输入（EN和 \overline{EN} ），用户得以控制四个接收器的输出状态。这些使能信号可激活或禁用接收器，并分别将输出切换至有效电平状态或高阻态（参见表1）。当多个UM3403UG器件的输出端复用连接时，高阻态模式可将静态功耗降至10 mW以下。

	Charged –Device Model		± 500		V		

Note 1: Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

Note 2: Tested with 100 MHz input frequency on all channels, $EN = V_{CC}$, $\bar{EN} = GND$.

Note 3: Output short-circuit current (I_{os}) is specified as magnitude only; a minus sign indicates direction only. Note that only one output should be shorted at a time; do not exceed the maximum junction temperature specification ($150^\circ C$).

Note 4: Guaranteed by design and characterization. Not tested in production.

Note 5: The V_{CMR} range is reduced for larger V_{ID} . Example: if $V_{ID} = 400$ mV, the V_{CMR} is 0.2 V to 2.2 V. A V_{ID} up to V_{CC} may be applied to the IN/\bar{IN} inputs with the Common-Mode voltage set to $V_{CC}/2$. Propagation delay and Differential Pulse skew decrease when V_{ID} is increased from 200 mV to 400 mV. Skew specifications apply for $200 \text{ mV} \leq V_{ID} \leq 800 \text{ mV}$ over the common-mode range.

Note 1: Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

Note 2: Generator waveform for all tests, unless otherwise specified: f=50MHz, C_L=10pF (includes jig capacitance), t_r and t_f (10% to 90%) ≤ 2 ns for INx/INx.

Note 3: f_{MAX} generator input conditions: t_r = t_f < 1ns (10% to 90%), 50% duty cycle, differential (1.05V to 1.35V peak to peak). Output Criteria: 40% to 60% duty cycle, V_{OL} (max 0.4V), V_{OH} (min 2.7V), C_L = 10pF (stray plus probes)

Note 4: Measured from the differential crosspoint of the input to V_{CC}/2 of the output.

Note 5: t_{SKEW(o-o)} is defined as skew between outputs of the same device at the same supply voltage and with equal load conditions.

Note 6: t_{SKEW(pp)} is defined as skew between outputs on different devices operating at the same supply voltages and with equal load conditions. Using the same type of inputs on each device, the outputs are measured at the differential cross points.

Note 7: t_{SKEW(p)} is the magnitude difference in the differential propagation delay time between the positive-going edge and the negative-going edge of the same channel.

8 Detailed Description

8.1 Fail-Safe Feature

The multi-level receiver's internal fail-safe circuitry is designed to provide fail-safe protection for floating/open or terminated receiver inputs, and will output a stable High-level voltage state.

8.2 Open Input Pins.

The UM3403UG is a quad receiver device, and if an application requires only 1, 2 or 3 receivers, the unused channel(s) inputs should be left OPEN. The internal input circuitry will ensure a HIGH stable output state for open inputs.

8.3 Terminated Input.

If the driver to the input is disconnected, in a TRI-STATE or power-off condition, the output will again be in a HIGH state, even with a 100Ω termination resistor across the input pins. Do not connect unused receiver inputs to ground or any other voltages.
