

**$\pm 15\text{kV}$ ESD 保护、失效保护、热插拔、
自动极性反转 RS-485 收发器**

UM3487E SOP8/DIP8

描述

UM3487E系列是一款具有+3.3V供电、 $\pm 15\text{kV}$ ESD保护、失效保护、热插拔、自动极性反转功能的RS-485收发器。这些器件具有失效保护电路，可在接收器输入开路、短路或闲置时确保接收器输出为逻辑高电平。这意味着如果端接总线上的所有发射器都被禁用（高阻抗），接收器输出将为逻辑高电平。UM3487E具有低摆率驱动器，可降低EMI并减少因电缆端接不当引起的反射，从而实现高达500kbps的无误差数据传输。所有发射器输出和接收器输入均能够耐受 $\pm 8\text{kV}$ 的人体放电模型和 $\pm 15\text{kV}$ 的IEC61000-4-2标准的空气间隙放电。

UM3487E具备电缆自动反转功能，可在电缆连接错误时反转RS485总线引脚的极性。即使接收器极性反转，也能保持接收器的完整故障安全功能。

这些收发器在空载时或满载且禁用驱动器时的典型电源电流消耗为300 μA 。所有器件都具有1/8单位负载接收器输入阻抗，支持总线连接多达256个节点，适用于半双工通信。

应用

- 智能电表/自动抄表系统
- 工业控制局域网
- PROFIBUS 和其他基于 RS-485 的现场总线网络
- 建筑照明和环境控制系统
- 高节点数 RS-485 系统
- 适用于 EMI 敏感应用的收发器

特性

- 自动极性反转 RS-485 收发器
- I/O 逻辑电平与 +5V、+3.3V 和 +1.8V 逻辑电平兼容
- RS-485 I/O 引脚提供 ESD 保护
 - $\pm 15\text{kV}$ —IEC61000-4-2, 空气间隙放电
 - $\pm 8\text{kV}$ —IEC61000-4-2, 接触放电
- 真正的失效保护接收器
- 增强型压摆率限制
- 共模输入电压范围: -7V 至 +12V
- 支持总线连接多达 256 个收发器
- 热关断
- 驱动过载限流保护

Note 4: The device is put into shutdown by bringing /RE high and DE low. If the enable inputs are in this state for less than 50ns, the device is guaranteed not to enter shutdown. If the enable inputs are in this state for at least 600ns, the device is guaranteed to have entered shutdown.

Non-Polarity Features

The Polarities of driver and receiver is always kept the same status. When DE=/RE=LOGIC 0 and RO is standing LOGIC 0 for T_s time, the polarities will be reversed automatically.

Parameter	Symbol	Test Conditions	Min	Typ	Max	Unit
Waiting Time for Inverting	T_s	DE=/RE=L, RO keeps L	150	200	250	ms

Pin Description

Pin Number	Symbol	Function
1	RO	Receiver Output.
2	/RE	Receiver Enable. Drive /RE low to enable Receiver, RO is high impedance when /RE is high. Drive /RE high and DE low to enter low-power shutdown mode.
3	DE	Driver Enable. Drive DE high to enable drivers. The outputs are high impedance when DE is low. Drive /RE high and DE low to enter low-power shutdown mode.
4	DI	Driver Input.
5	GND	Ground
6	L2	Auto Polarity Reversal Receiver Input and Driver Output Pin. When power up, the bus pins have their normal polarity definition of L2 as non-inverting and L1 as inverting; otherwise L2 become inverting and L1 become non inverting for reversal status.
7	L1	
8	V _{CC}	Power Supply for RS-485 transceiver

RS-485 Communication Function Table

Detail Description

Polarity Reversal Function

With large node count RS485 network, it is common for some cable data lines to be wired backwards during installation. When this happens, the node is unable to communicate over, he must then rewire the connector, which is time consuming.

The UM3487E simplifies this task by including an automatic polarity reversal function inside. Upon UM3487E power up, when DE=/RE=logically low, and RO keeps logic low over a predefined time T_S (i.e. $T_S=200\text{ms}$ in UM3487E), the chip reverse its bus pins polarity, so B become non-inverting, and A become inverting. Otherwise, the chip operates like any standard RS485 transceiver, and the bus pins have their normal polarity definition of A as non inverting and B as inverting.

Union Semi's unique automatic polarity reversal function is superior to that found on competing devices, because the receiver's full fail safe function is maintained, even when the RX polarity is reversed.

Fail-Safe and Hot-Swap

The UM3487E guarantees a logic high receiver output when the receiver inputs are shorted or open, or when they are connected to a terminated transmission line with all drivers disabled. This is done by setting the receiver input threshold between -50mV and -200mV . If the differential receiver input voltage V_{ID} is greater than or equal to -50mV , RO is logic high. If V_{ID} is less than or equal to -200mV , RO is logic low. In the case of a terminated bus with all transmitters disabled, the receiver's differential input voltage is pulled to 0V by the termination. With the receiver threshold of UM3487E, this results in logic high with a 50mV minimum noise margin, and this -50mV to -200mV threshold complies with the $\pm 200\text{mV}$ EIA/TIA-485 standard.

When circuit boards with RS485 transceiver are inserted into a hot or powered backplane, differential disturbances to the data bus can lead to data errors. Upon initial circuit board insertion, the microprocessor undergoes its own power-up sequence. During this period, the processor's logic output drivers are high impedance and unable to drive the DE and /RE inputs of these devices to a defined logic level. Leakage currents up to $\pm 10\mu\text{A}$ from the high impedance state of processor's logic drivers could cause standard CMOS enable inputs of a transceiver to drift to an incorrect logic level. Additionally, parasitic circuit board capacitance could cause coupling of V_{CC} or GND to the enable inputs. Without the hot-swap capability, these facts could improperly enable the transceiver's driver or receiver.

When V_{CC} rises, an internal pull down circuit holds DE low and /RE high. After the initial power up sequence, the pull down/pull up circuit becomes transparent, resetting the hot-swap tolerable input. This hot-swap input circuit enhances UM3487E's performance in harsh environment application.

$\pm 15\text{kV}$ ESD Protection

All pins on UM3487E device include ESD protection structures, and the family incorporates advanced structures which allow the RS-485 pins (L1, L2) to survive ESD events up to $\pm 15\text{kV}$. The RS-485 pins are particularly vulnerable to ESD damage because they typically connect to an exposed port on the exterior of the finished product. The ESD structures withstand high ESD in all states: normal operation, shutdown, and powered down. After an ESD event, circuits keep working without latch up. The ESD protection can be tested in various ways and with reference to the ground pin. The L1, L2 are characterized for protection to the following limits: $\pm 8\text{kV}$ using the Human Body Model and $\pm 15\text{kV}$ using the IEC61000-4-2, Air-Gap Discharge, and $\pm 8\text{kV}$ Contact Discharge. The logic pins (RO, /RE, DE, DI) are characterized for protection to the following limits: $\pm 2\text{kV}$ using the Human Body Model.

Applications Information

Non-Polarity transceiver

When established the non-polarity RS-485 net, you should pay attention to two conditions. First, a pair of bias resistance (pull-up to +5V for RS-485 A bus, push-down to GND for RS-485 B bus) must be required, usually be built in the master node, or independently, 500 Ω resistance is recommended. The other nodes don't need bias resistance anymore. Second, the transceiver rate must be higher than 100bps or the maximum transmitting time for low logic should be less than 100ms.

256 Transceivers on the Bus

The standard RS-485 receiver input impedance is 12k Ω (one unit load), and the standard driver can drive up to 32 unit loads. The Union family of transceivers have a 1/8 unit load receiver input impedance (96k Ω), allowing up to 256 transceivers to be connected in parallel on one communication line. Any combination of these devices and/or other RS-485 transceivers with a total of 32 unit loads or less can be connected to the line.

Low-Power Shutdown Mode

Low-power shutdown mode is initiated by bringing both /RE high and DE low. In shutdown, the device typically draws only 10uA of supply current. /RE and DE may be driven simultaneously; the parts are guaranteed not to enter shutdown if /RE is high and DE is low for less than 50ns. If the inputs are in this state for at least 600ns, the parts are guaranteed to enter shutdown. Enable times t_{ZH} and t_{ZL} in the Switching Characteristics tables assume the part was not in a low-power shutdown state. Enable times $t_{ZH(SHDN)}$ and $t_{ZL(SHDN)}$ assume the parts were shut down. It takes drivers and receivers longer to become enabled from low-power shutdown mode ($t_{ZH(SHDN)}$, $t_{ZL(SHDN)}$) than from driver/receiver-disable mode (t_{ZH} , t_{ZL}).

Driver Output Protection

Two mechanisms prevent excessive output current and power dissipation caused by faults or by bus contention. The first, a foldback current limit on the output stage, provides immediate protection against short circuits over the whole common-mode voltage range (see Typical Operating Characteristics). The second, a thermal shutdown circuit, forces the driver outputs into a high-impedance state if the die temperature becomes excessive.

Line Length vs. Data Rate

The RS-485/RS-422 standard covers line lengths up to 4000 feet. For line lengths greater than 4000 feet, repeater is required.

Typical Applications

The UM3487E transceivers are designed for bidirectional data communications on multipoint bus transmission lines. To minimize reflections, the line should be terminated at both ends in its characteristic impedance, and stub lengths off the main line should be kept as short as possible.
