UM74AVC8T245UO TSSOP24
UM74AVC8T245QB QFN24 3.5×5.5

1 描述

UM74AVC8T245 器件设计用于实现两条数据总线之间的异步通信。该器件根据方向控制输入(DIR)的逻辑电平,将数据从 A 总线传输到 B 总线,或从 B 总线传输到 A 总线。输出使能输入 ($\overline{OE}$) 可用于禁用输出,从而使总线实现有效隔离。UM74AVC8T245 的逻辑控制引脚 (DIR 和 $\overline{OE}$) 以 V_{CCA} 电压为基准。

该器件专用于使用 I_{OFF} 的局部断电应用。 I_{OFF} 电路可禁用输出,以防在器件断电时电流回流对器件造成损坏。 V_{CC} 隔离特性可确保任一 V_{CC} 输入在低于 100mV 时,所有输出都被禁用且处于高阻抗状态。要在上电或断电期间将器件置于高阻抗状态,应通过一个上拉电阻器将 $\overline{OE}$ 连接至 V_{CC} ; 该电阻的最小值由驱动器的电流灌入能力决定。

UM74AVC8T245 系列提供 TSSOP24 和 QFN24 3.5×5.5 共 2 种封装。

Notes:

- A. C_L includes probe and jig capacitance.
- B. Waveform 1 is for an output with internal conditions such that the output is low, except when disabled by the output control. Waveform 2 is for an output with internal conditions such that the output is high, except when disabled by the output control.
- C. All input pulses are supplied by generators having the following characteristics: $PRR \leq 10$ MHz, $Z_O = 50\Omega$, $dv/dt \geq 1V/ns$.
- D. The outputs are measured one at a time, with one transition per measurement.
- E. t_{PLZ} and t_{PHZ} are the same as t_{DIS} .
- F. t_{PZL} and t_{PZH} are the same as t_{EN} .
- G. t_{PLH} and t_{PHL} are the same as t_{PD} .
- H. V_{CCI} is the V_{CC} associated with the input port.
- I. V_{CCO} is the V_{CC} associated with the output port.

9 Detailed Description

9.1 Overview

The UM74AVC8T245 device is an 8-bit, dual-supply non-inverting transceiver with bidirectional voltage level translation. The I/O pins labeled with A and the control pins (DIR and $\overline{\text{OE}}$) are supported by V_{CCA} , and the I/O pins labeled with B are supported by V_{CCB} . The A port and the B port are able to accept I/O voltages ranging from 1 V to 3.6 V.

9.2 Functional Block Diagram

Figure 9-1. UM74AVC8T245 Block Diagram

10 Feature Description

10.1 Fully Configurable Dual-Rail Design

The fully configurable dual-rail design allows each port to operate over the full 1 V to 3.6 V power-supply range. Both V_{CCA} and V_{CCB} can be supplied at any voltage between 1 V and 3.6 V making the device an excellent choice for translating between any of the low voltage nodes (1 V, 1.2 V, 1.8 V, 2.5 V and 3.3 V).

10.2 I_{OFF} Supports Partial-Power-Down Mode Operation

I_{OFF} prevents backflow current by disabling I/O output circuits when device is in partial power-down mode. The inputs and outputs for this device enter a high-impedance state when the device is powered down, inhibiting current backflow into the device. The maximum leakage into or out of any input or output pin on the device is specified by I_{OFF} in the Electrical Characteristics.

10.3 V_{CC} Isolation

The I/Os of both ports will enter a high-impedance state when one of the supplies are at GND, while the other supply is still connected to the device (I_{OZ} shown in Electrical Characteristics).

10.4 Device Functional Modes

All control inputs are referenced to V_{CCA} and must be driven to a valid Logic High or Logic Low (that is, not floating) to assure proper device operation and to prevent excessive power consumption. Table 10-1 summarizes the possible modes of device operation based on the configuration of the control inputs.

Table 10-1. Function Table

Control Inputs		Output Circuits		Operation
$\overline{OE}$	DIR	A port	B port	
L	L	Enabled	Hi-Z	B data to A bus
L	H	Hi-Z	Enabled	A data to B bus
H	X	Hi-Z	Hi-Z	Isolation
