1 描述

UM74AVC8TX245 旨在实现数据总线间的异步通信。根据方向控制输入（DIR1 和 DIR2）的逻辑电平，此器件将数据从 A 总线传输至 B 总线，或者将数据从 B 总线传输至 A 总线。输出使能（$\overline{OE}$）输入可用于禁用输出，从而有效隔离总线。

UM74AVC8TX245 旨在使控制引脚（DIR 和 $\overline{OE}$）以 V_{CCA} 电压为基准。该器件专用于使用 I_{OFF} 的局部断电应用。当器件断电时，I_{OFF} 电路将会禁用输出。这会抑制电流反流到器件中，从而防止损坏器件。V_{CC} 隔离功能旨在确保当任一 V_{CC} 输入电源低于 100mV 时，所有电平转换器输出都将禁用并处于高阻抗状态。要在上电或断电期间将该器件的 I/O 置于高阻抗状态，请通过一个上拉电阻将 $\overline{OE}$ 连接至 V_{CCA}；该电阻的最小值由驱动器的电流灌入能力决定。

UM74AVC8TX245 系列采用 TSSOP24、QFN24 2.0×4.0 和 QFN24 3.5×5.5 封装。

9 Detailed Description

9.1 Overview

The UM74AVC8TX245 is an 8-bit, dual-supply non-inverting transceiver with bidirectional voltage level translation. The I/O pins labeled with A and the control pins (DIR1, DIR2 and $\overline{OE}$) are supported by V_{CCA}, and the I/O pins labeled with B are supported by V_{CCB}. The A port and the B port are able to accept I/O voltages ranging from 1 V to 3.6 V.

9.2 Functional Block Diagram

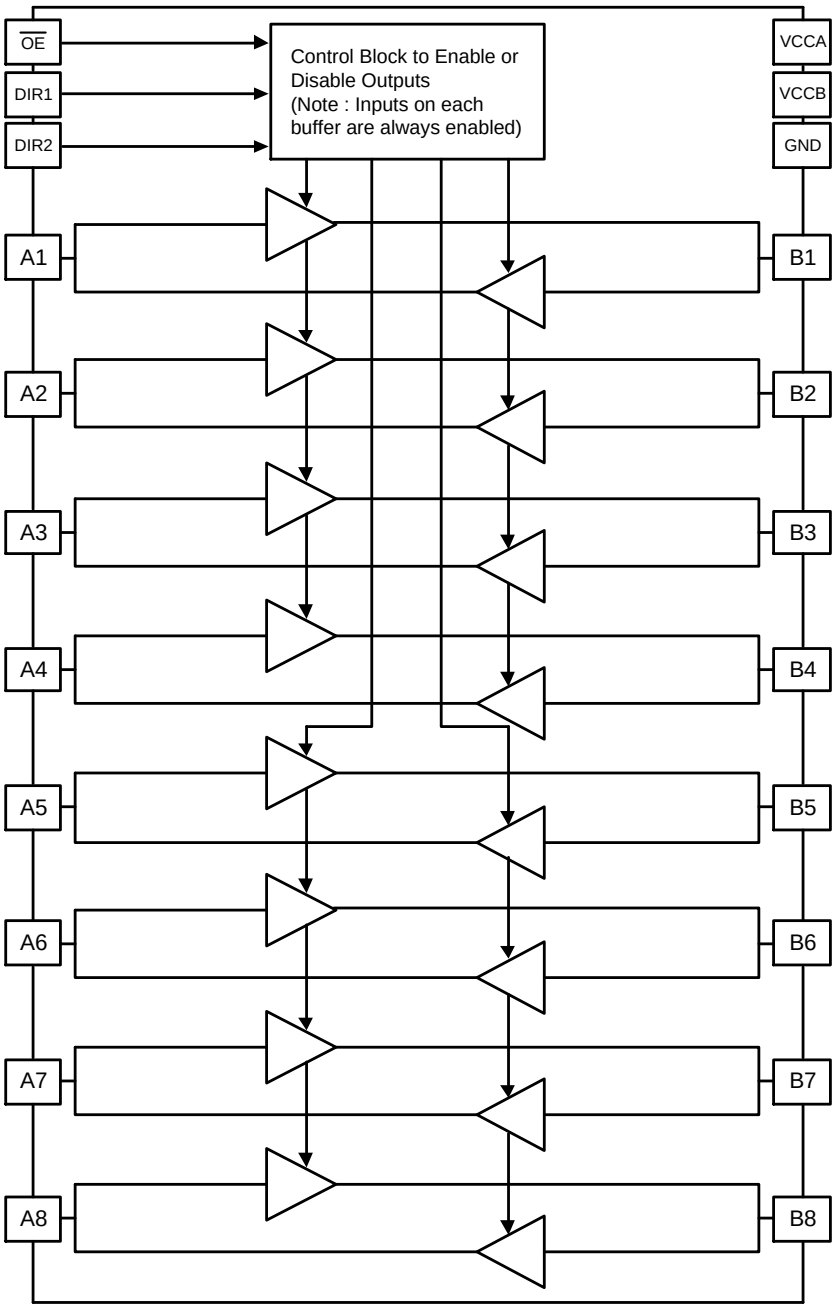

Figure 9-1. UM74AVC8TX245 Block Diagram

10 Feature Description

10.1 Fully Configurable Dual-Rail Design

The fully configurable dual-rail design allows each port to operate over the full 1 V to 3.6 V power-supply range. Both V_{CCA} and V_{CCB} can be supplied at any voltage between 1 V and 3.6 V making the device an excellent choice for translating between any of the low voltage nodes (1 V, 1.2 V, 1.8 V, 2.5 V and 3.3 V).

10.2 Multiple Direction Control Pins

Two control pins are used to configure the 8 data I/Os. I/O channels 1 through 4 are grouped together and I/O channels 5 through 8 are banked together. The benefit of this is to permit simultaneous up-translation and down-translation within one device. This eliminates the need for multiple devices, where each device can only provide up-translation or down-translation sequentially.

10.3 I_{OFF} Supports Partial-Power-Down Mode Operation

I_{OFF} prevents backflow current by disabling I/O output circuits when device is in partial power-down mode. The inputs and outputs for this device enter a high-impedance state when the device is powered down, inhibiting current backflow into the device. The maximum leakage into or out of any input or output pin on the device is specified by I_{OFF} in the Electrical Characteristics.

10.4 I/Os with Integrated Static Pull-Down Resistors

To help avoid floating inputs on the I/Os, this device has 288kΩ typical integrated weak pull-downs on all data I/Os. This feature allows all inputs to be left floating without the concern for unstable outputs or increased current consumption. This also helps to reduce external component count for applications where not all channels are used or need to be fixed low. If an external pull-up is required, it should be no larger than 30kΩ to avoid contention with the 288kΩ internal pull-down.

10.5 V_{CC} Isolation

The I/Os of both ports will enter a high-impedance state when one of the supplies are at GND, while the other supply is still connected to the device (I_{OZ} shown in Electrical Characteristics).

10.6 Device Functional Modes

All control inputs are referenced to V_{CCA} and must be driven to a valid Logic High or Logic Low (that is, not floating) to assure proper device operation and to prevent excessive power consumption. Table 10-1 summarizes the possible modes of device operation based on the configuration of the control inputs.

11 Application Information

11.1 Application Information

The UM74AVC8TX245 can be used in level-translation applications for interfacing devices or systems operating at different voltage nodes. Typical Application Circuit depicts an application in which the UM74AVC8TX245 is up-translating a 1.8V input to a 3.3V output to interface between a system controller and a peripheral device.
